The Cobb County Water System (CCWS) is committed to delivering to you, our customer, water that meets or exceeds federal and state quality requirements. We are pleased that this 2016 Water Quality Report shows we are doing that. Our priority is to deliver safe water to your home or business each day. We make significant efforts to protect our water resources for both existing needs and future generations.

The following pages provide the summary results of a continuous drinking water testing program. This report covers the calendar year 2015. Important definitions are provided to help clarify the information further. The CCWS’s Water Quality Report is also posted on our website at www.cobbcounty.org/images/documents/water/2016-Water-Report.pdf. For additional information contact our Customer Service Division at 770.459.6200.

The bottom line is we provide safe, quality drinking water to you 24 hours a day, seven days a week, 365 days each year, because we know that it is vital to the health and well-being of our community.

WHERE DOES MY WATER COME FROM?

You are a customer of the CCWS, an agency of Cobb County government. We distribute treated water to more than 179,000 customer accounts representing about 733,000 residents in the CCWS’s service area, and treat collected wastewater in a manner safe for your families and the environment.

The Water System purchases water from the Cobb County-Marietta Water Authority (CCMWA), a utility providing treated drinking water on a wholesale basis to cities and counties in the region. CCMWA treats drinking water using state-of-the-art equipment and ensures water quality through continued monitoring and testing.

The CCMWA was created by the Georgia Legislature in 1951 for the purpose of providing potable water to Cobb County. The CCMWA has two surface water sources supplying two treatment facilities. The Wyckoff Treatment Division is supplied from Lake Allatoona, a Corps of Engineers impoundment in north Cobb, south Cherokee and south Bartow counties. The Quarles Treatment Division receives water from the Chattahoochee River. After treatment at these plants, water is transported to various areas within the County where it is fed into CCWS distribution lines and finally to your home or business.

The Cobb County – Marietta Water Authority and the Atlanta Regional Commission are joint owners of the Chattahoochee River. The process begins by pumping untreated water from the Chattahoochee River or Lake Allatoona, a Corps of Engineers impoundment in north Cobb, south Cherokee, and south Bartow counties. The Quarles Treatment Division receives water from the Chattahoochee River. After treatment at these plants, water is transported to various areas within the County where it is fed into CCWS distribution lines and finally to your home or business.

The Cobb County – Marietta Water Authority and the Atlanta Regional Commission operate the Wyckoff Treatment Division which treats water from Lake Allatoona. After filtration, chemicals are added for final disinfection. Except for chlorine and fluoride, chemicals used in the treatment process are removed before the finished water is distributed to you.

The CCWS provides an understanding of the drinking water supply’s susceptibility to contamination. A Source Water Assessment is a study and report which provides the following:

• Identifies the area of land that contributes the raw water used for drinking water,
• Identifies potential sources of contamination to drinking water supplies, and
• Provides an understanding of the drinking water supply’s susceptibility to contamination.

For more information on this project visit the Source Water Assessment website at http://www.atlantaregional.com/environment/water/source-water-assessment-project or you can request information by mail from the ARC.

Atlanta, GA. 30303

HOW IS THE WATER TREATED?

The process begins by pumping untreated water from the Chattahoochee River or Lake Allatoona into sedimentation basins where large particles are removed and the water is disinfected.

The water is then directed to a process called flocculation which is a gentle mixing of the water with a coagulant. This allows particles, called floc, to form and settle, clarifying the water. Next, the water is put through a filtration system where water flows through sand filters trapping even smaller particles.

After filtration, chemicals are added for final disinfection. Except for chlorine and fluoride, chemicals used in the treatment process are removed before the finished water is distributed to you.

WHY ARE THERE CONTAMINANTS?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

a) Microbial contaminants such as viruses and bacteria which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.

b) Inorganic contaminants such as salts and metals which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.

c) Pesticides and herbicides which may come from a variety of sources such as agriculture, storm water runoff, and residential uses.

d) Organic chemical contaminants, including synthetic (man-made) and volatile organics, which are by-products of industrial processes and petroleum production, and can also come from gasoline stations, urban storm water runoff, and septic systems.

e) Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

The U.S. Environmental Protection Agency (EPA) has established treatment methods to reduce contaminants to levels that protect human health. CCMWA’s laboratory continuously monitors water quality to be sure it is properly treated to EPA standards. In addition, up to 226 water samples throughout the CCWS distribution system are taken each month and tested. To ensure tap water is safe to drink, EPA prescribes limits on the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water.
Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA’s Safe Drinking Water Hotline at 1.800.426.4791.

WHAT IS CRYPTOSPORIDIOUM?

Cryptosporidium is a microbial pathogen found in surface water throughout the U.S. Although filtration removes Cryptosporidium, the most commonly-used filtration methods cannot guarantee 100 percent removal. Ingestion of Cryptosporidium may cause cryptosporidiosis, an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks; however, immuno-compromised individuals, infants, small children, and the elderly are at greater risk of developing life threatening illness. We encourage immuno-compromised individuals to consult their doctor regarding appropriate precautions to take to avoid infection. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water. The monitoring of our source water performed during the last testing period had no detection of cryptosporidium.

LEAD IN WATER

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The CCWS is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. The water has been treated to minimize leaching of such materials. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 or more seconds before using cold tap water for drinking, preparation, or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

HEALTH RELATED CONCERNS

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised individuals, such as persons undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly people, and infants, are particularly at risk. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available from the EPA’s Safe Drinking Water Hotline at 1.800.426.4791.

HOW TO READ THE DRINKING WATER ANALYSIS TABLE

The table shows the results of our water quality analyses. Every contaminant regulated by EPA that was detected in the water, even in the minutest traces, is listed here. The table contains the name of each substance, the highest level allowed by regulation (MCL), the ideal goals for public health (MCLG), the usual sources of such contamination, footnotes explaining our finding, and a key to units of measurement. Definitions of MCL, MCLG, AL, and TT are important.

DEFINITIONS

AL – Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must implement.

BDL – Below detection limits.

MCL – Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG – Maximum Contaminant Level Goal: The level of a contaminant in drinking water to which all of the scientific information points. It is not enforcement standard, but it does serve as a performance goal for water systems. MCLGs allow for a margin of safety.

MRDL – Maximum Residual Disinfectant Level: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for inactivation of microbiological contaminants.

MRDLG – Maximum Residual Disinfectant Level Goal: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect any benefits of disinfection to control microbial contaminants.

n/a – not applicable.

n/d – not detected.

NTU – Nephelometric Turbidity Unit: Measures the cloudiness of water in parts per billion or micrograms per liter (µg/L), e.g., penny in $10,000,000.

ppm – parts per million or milligrams per liter (mg/L), i.e., one penny in $1,000,000.

TT – Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.

Drinking Water Analysis Table

(The data presented in this report are submitted to the CCWSA and are from the most recent testing done in accordance with regulations.)

EPA Regulated Inorganic Substances or Contaminants

<table>
<thead>

</tbody>
</table>

Notes:

1. Turbidity is measured to help in the prevention of diseases in children.
2. 0.5% of the 99 data points exceeded the action level. The next round of testing is due in 2017.
3. The health risk of using this water is unknown at this time.
4. All data points were below detection levels.

How To Read The Drinking Water Analysis Table

Substance | Sample Date | MCL | MCLG | Detected Level | Range | Major Sources | Violation |

<td>NO</td>
</tr>
</tbody>
</table>

Notes:

1. Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of water quality. High turbidity can hinder the effectiveness of disinfectants.

COBB COUNTY WATER SYSTEM
LEAD AND COPPER CORROSION PREVENTION OVERVIEW

Cobb County Water System purchases all of their water wholesale from Cobb County-Marietta Water Authority. The Authority treats the water and sends it to the Water System’s distribution system to be delivered to homes and businesses in Cobb. Water works in partnership with the Authority to ensure high quality drinking water. The primary source of lead and copper in a drinking water system is from private plumbing systems including the service line from the meter and the piping inside homes (copper piping with solder containing lead and copper in a drinking water system is from private plumbing systems). The Authority treats the water and sends it to the Water System’s distribution system to be delivered to homes and businesses in Cobb. The Authority treats the water and sends it to the Water System’s distribution system to be delivered to homes and businesses in Cobb. To protect water consumers from lead and copper corrosion, Cobb County-Marietta Water Authority treats the drinking water to inhibit leaching of lead and copper from the plumbing system. For more information visit https://cobbgov.org/index.php/water/water-taste-report.

COBB WATER’S EDUCATION PROGRAMS INCLUDE:

- Watershed Stewardship
- Backflow Prevention
- Grease Management
- Partners in Education
- Stormwater Management
- Water Efficiency
- CMOM Program
